## TPS22976DPUR

## TI,Texas Instruments

Power Switch ICs - Power Distribution 5.5V, 6A, 14m , Dual Load Switch with Adj. Rise Time \& Optional QOD for Cost-Conscious Applications 14-WSON -40 to 105

Any questions, please feel free to contact us.
info@kaimte.com

Texas
TPS22976

## TPS22976 5.7-V, 6-A, 14-m $\Omega$ On-Resistance Dual-Channel Load Switch

## 1 Features

- Integrated dual-channel load switch
- Input voltage range: 0.6 V to $\mathrm{V}_{\text {BIAS }}$
- $V_{\text {BIAS }}$ voltage range: 2.5 V to 5.7 V
- On-resistance
- $\mathrm{R}_{\mathrm{ON}}=14 \mathrm{~m} \Omega$ (typical)

$$
\text { at } \mathrm{V}_{I N}=0.6 \mathrm{~V} \text { to } 5 \mathrm{~V}, \mathrm{~V}_{\mathrm{BIAS}}=5 \mathrm{~V}
$$

- $\mathrm{R}_{\mathrm{ON}}=18 \mathrm{~m} \Omega$ (typical)

$$
\text { at } \mathrm{V}_{\mathrm{IN}}=0.6 \mathrm{~V} \text { to } 2.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{BIAS}}=2.5 \mathrm{~V}
$$

- 6-A maximum continuous switch current per channel
- Quiescent current for TPS22976, TPS22976N
- $37 \mu \mathrm{~A}$ (typical, both channels) at $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {BIAS }}=5 \mathrm{~V}$
- $35 \mu \mathrm{~A}$ (typical, single channel) at $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {BIAS }}=5 \mathrm{~V}$
- Quiescent current for TPS22976A
- $85 \mu \mathrm{~A}$ (typical, both channels) at $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {BIAS }}=5 \mathrm{~V}$
- $83 \mu \mathrm{~A}$ (typical, single channel) at $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {BIAS }}=5 \mathrm{~V}$
- Control input threshold enables use of 1.2-, 1.8-, 2.5-, and 3.3-V logic
- Configurable rise time
- Fast turn ON time (TPS22976A)
$-t_{\mathrm{ON}}=17 \mu \mathrm{~s}$ at $\mathrm{V}_{\mathrm{IN}}=1.05 \mathrm{~V}$
- Thermal shutdown
- Quick Output Discharge (QOD) (optional)
- SON 14-pin package with thermal pad
- ESD performance tested per JESD 22
- 2-kV HBM and 1-kV CDM

## 2 Applications

- Ultrabook ${ }^{\text {TM }}$
- Notebooks and Netbooks
- Tablet PCs
- Set-top Boxes and Residential Gateways
- Telecom Systems
- Solid-State Drives (SSD)

## 3 Description

The TPS22976 product family consists of three devices: TPS22976, TPS22976A and TPS22976N. Each device is a dual-channel load switch with controlled turnon. The device contains two N-channel MOSFETs that can operate over an input voltage range of 0.6 V to 5.7 V , and can support a maximum continuous current of 6 A per channel. Each switch is independently controlled by an on and off input (ON1 and ON2), which can interface directly with lowvoltage control signals. The TPS22976 is capable of thermal shutdown when the junction temperature is above the threshold, turning the switch off. The switch turns on again when the junction temperature stabilizes to a safe range. The TPS22976 also offers an optional integrated $230-\Omega$ on-chip load resistor for quick output discharge when the switch is turned off.
The TPS22976 is available in a small, space-saving $3-\mathrm{mm} \times 2-\mathrm{mm}$ 14-SON package (DPU) with integrated thermal pad allowing for high power dissipation. The device is characterized for operation over the free-air temperature range of $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$.

Device Information ${ }^{(1)}$

| PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| :--- | :--- | :---: |
| TPS22976 |  |  |
| TPS22976A | WSON (14) | $3.00 \mathrm{~mm} \times 2.00 \mathrm{~mm}$ |
| TPS22976N |  |  |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

Changes from Revision B (September 2017) to Revision C (September 2020) Page

- Added quiescent current and rise time for TPS22976A in the Features list. ..... 1
- Added TPS22976A to the Device Information table ..... 1
- Added Switching Characteristics (TPS22976A) table ..... 5
- Added a line for quiescent current for TPS22976A in all of the Specifications tables ..... 5
- Added two quiescent current graphs in Typical DC Characteristics for the TPS22976A. ..... 10
- Added section for the TPS22976A in Typical AC Characteristics ..... 13
- Added CT pin equation for the TPS22976A in Adjustable Rise Time section. ..... 27
Changes from Revision A (March 2017) to Revision B (September 2017) ..... Page
- Updated $\mathrm{V}_{\mathrm{IH}}$ in Recommended Operating Conditions ..... 5
Changes from Revision * (February 2016) to Revision A (March 2017) Page
- Updated statement for Equation 4 in Adjustable Rise Time section from "CT $=0$ pF" to "CT < 100 pF ". ..... 27

## 6 Pin Configuration and Functions

Figure 6-1. DPU Package 14-Pin WSON with Exposed Thermal Pad Top View

Figure 6-2. DPU Package 14-Pin WSON with Exposed Thermal Pad Bottom View

## Pin Functions

| PIN |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NO. | NAME |  |  |
| 1 | VIN1 | I | Switch 1 input. Recommended voltage range for these pins for optimal $R_{O N}$ performance is 0.6 V to $\mathrm{V}_{\text {BIAs }}$. Place an optional decoupling capacitor between these pins and GND to reduce $\mathrm{V}_{\mathrm{IN} 1}$ dip during turnon of the channel. See the Application Information section for more information. |
| 2 |  |  |  |
| 3 | ON1 | 1 | Active-high switch 1 control input. Do not leave floating. |
| 4 | VBIAS | I | Bias voltage. Power supply to the device. Recommended voltage range for this pin is 2.5 V to 5.7 V . See the Application Information section. |
| 5 | ON2 | 1 | Active-high switch 2 control input. Do not leave floating. |
| 6 | VIN2 | I | Switch 2 input. Recommended voltage range for these pins for optimal $R_{O N}$ performance is 0.6 V to $\mathrm{V}_{\text {BIAS. }}$. Place an optional decoupling capacitor between these pins and GND to reduce $\mathrm{V}_{\text {IN2 }}$ dip during turnon of the channel. See the Application Information section for more information. |
| 7 |  |  |  |
| 8 | VOUT2 | 0 | Switch 2 output. |
| 9 |  |  |  |
| 10 | CT2 | 0 | Switch 2 slew rate control. Can be left floating. Capacitor used on this pin must be rated for a minimum of 25 V for desired rise time performance. |
| 11 | GND | - | Ground. |
| 12 | CT1 | 0 | Switch 1 slew rate control. Can be left floating. Capacitor used on this pin must be rated for a minimum of 25 V for desired rise time performance. |
| 13 | VOUT1 | 0 | Switch 1 output. |
| 14 |  |  |  |

| PIN |  | I/O |  |
| :---: | :---: | :---: | :--- |
| NO. | NAME |  | DESCRIPTION |
| - | Thermal pad | - | Thermal pad (exposed center pad) to alleviate thermal stress. Tie to GND. See the Layout section for <br> layout guidelines. |

INSTRUMENTS

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {IN1,2 }}$ | Input Voltage | -0.3 | 6 | V |
| $\mathrm{V}_{\text {OUT1,2 }}$ | Output Voltage | -0.3 | 6 | V |
| $\mathrm{V}_{\text {ON1,2 }}$ | ON Pin Voltage | -0.3 | 6 | V |
| $\mathrm{V}_{\text {BIAS }}$ | Bias Voltage | -0.3 | 6 | V |
| $\mathrm{I}_{\text {MAX }}$ | Maximum continuous current per channel |  | 6 | A |
| $\mathrm{I}_{\text {MAX,PLS }}$ | Maximum pulsed current switch per channel, pulse $<300 \mu \mathrm{~s}, 3 \%$ duty cycle |  | 8 | A |
| $\mathrm{T}_{J}$ | Junction temperature |  | 125 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Rating may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Condition. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

|  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {(ESD) }}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins ${ }^{(1)}$ | $\pm 2000$ | V |
|  |  | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ${ }^{(2)}$ | $\pm 1000$ |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|  |  | MIN | NOM | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {IN } 1,2}$ | Input Voltage | 0.6 |  | $\mathrm{V}_{\text {BIAS }}$ | V |
| $\mathrm{V}_{\text {BIAS }}$ | Bias Voltage | 2.5 |  | 5.7 | V |
| $\mathrm{V}_{\text {ON1,2 }}$ | ON Pin Voltage | 0 |  | 5.7 | V |
| V OUT1,2 | Output Voltage | 0 |  | $\mathrm{V}_{\mathrm{IN}}$ | V |
| $\mathrm{V}_{\mathrm{IH}}$ | High-Level Input Voltage, ON | 1.2 |  | 5.7 | V |
| $\mathrm{V}_{\text {IL }}$ | Low-Level Input Voltage, ON | 0 |  | 0.5 | V |
| $\mathrm{T}_{\text {A }}$ | Ambient Temperature | -40 |  | 105 | ${ }^{\circ} \mathrm{C}$ |

### 7.4 Thermal Information

| THERMAL METRIC ${ }^{(1)}$ |  | TPS22976 | UNIT |
| :---: | :---: | :---: | :---: |
|  |  | DPU (WSON) |  |
|  |  | 14 PINS |  |
| $\mathrm{R}_{\text {өJA }}$ | Junction-to-ambient thermal resistance | 50.8 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case (top) thermal resistance | 52.3 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance | 18.4 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JT }}$ | Junction-to-top characterization parameter | 1.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JB }}$ | Junction-to-board characterization parameter | 18.6 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case (bottom) thermal resistance | 6.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

### 7.5 Electrical Characteristics (VBIAS = 5V)

over operating free-air temperature range (unless otherwise noted)

## 9 Detailed Description

### 9.1 Overview

The TPS22976 is a 5.7-V, dual-channel, 14-m (typical) $\mathrm{R}_{\mathrm{ON}}$ load switch in a 14-pin WSON package. Each channel can support a maximum continuous current of 6 A and is controlled by an on and off GPIO-compatible input. To reduce the voltage drop in high current rails, the device implements N -channel MOSFETs. Note that the ON pins must be connected and cannot be left floating. The device has a configurable slew rate for applications that require specific rise-time, which controls the inrush current. By controlling the inrush current, power supply sag can be reduced during turnon. Furthermore, the slew rate is proportional to the capacitor on the CT pin. See the Adjustable Rise Time section to determine the correct CT value for a desired rise time.

The internal circuitry is powered by the $\mathrm{V}_{\text {BIAS }}$ pin, which supports voltages from 2.5 V to 5.7 V . This circuitry includes the charge pump, QOD (optional), and control logic. When a voltage is applied to $\mathrm{V}_{\text {BIAS }}$, and the $\mathrm{ON}_{1,2}$ pins transition to a low state, the QOD functionality is activated. This connects $\mathrm{V}_{\text {OUT1 }}$ and $\mathrm{V}_{\text {OUT2 }}$ to ground through the on-chip resistor. The typical pulldown resistance $\left(R_{P D}\right)$ is $230 \Omega$.

During the off state, the device prevents downstream circuits from pulling high standby current from the supply. The integrated control logic, driver, power supply, and output discharge FET eliminates the need for any external components, reducing solution size and bill of materials (BOM) count.

### 9.2 Functional Block Diagram

Copyright © 2016, Texas Instruments Incorporated
Figure 9-1. TPS22976 Functional Block Diagram

### 9.3 Feature Description

### 9.3.1 ON and OFF Control

The ON pins control the state of the switch. Asserting ON high enables the switch. ON is active high with a low threshold, making it capable of interfacing with low-voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be tied either high or low for proper functionality.

### 9.3.2 Input Capacitor (Optional)

To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor, a capacitor needs to be placed between VIN and GND. A 1- $\mu \mathrm{F}$ ceramic capacitor, $\mathrm{C}_{\mathrm{IN}}$, placed close to the pins is usually sufficient. Higher values of $\mathrm{C}_{\mathrm{IN}}$ can be used to further reduce the voltage drop during high-current application. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

### 9.3.3 Output Capacitor (Optional)

Due to the integrated body diode in the NMOS switch, a $C_{I N}$ greater than $C_{L}$ is highly recommended. $A C_{L}$ greater than $\mathrm{C}_{\text {IN }}$ can cause $\mathrm{V}_{\text {OUT }}$ to exceed $\mathrm{V}_{\text {IN }}$ when the system supply is removed. This could result in current flow through the body diode from VOUT to VIN. A $C_{\mathbb{I N}}$ to $C_{L}$ ratio of 10 to 1 is recommended for minimizing $V_{I N}$ dip caused by inrush currents during startup, however a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1 ) could cause slightly more $\mathrm{V}_{\text {IN }}$ dip upon turnon due to inrush currents. This can be mitigated by increasing the capacitance on the CT pin for a longer rise time (see the Adjustable Rise Time section).

### 9.3.4 Quick Output Discharge (QOD) (Not Present in TPS22976N)

The TPS22976 and TPS22976A include a QOD feature. When the switch is disabled, an internal discharge resistance is connected between VOUT and GND to remove the remaining charge from the output. This resistance prevents the output from floating while the switch is disabled. For best results, it is recommended that the device gets disabled before $\mathrm{V}_{\text {BIAS }}$ falls below the minimum recommended voltage.

### 9.3.5 Thermal Shutdown

Thermal Shutdown protects the part from internally or externally generated excessive temperatures. When the device temperature exceeds $T_{S D}$ (typical $160^{\circ} \mathrm{C}$ ), the switch is turned off. The switch automatically turns on again if the temperature of the die drops 20 degrees below the $T_{S D}$ threshold.

## 10 Application and Implementation

## Note

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

This section highlights some of the design considerations for implementing the device in various applications. A PSPICE model for this device is also available on the product page for additional information.

### 10.1.1 Parallel Configuration

To increase current capabilities and to lower $\mathrm{R}_{\mathrm{ON}}$, both channels can be placed in parallel as seen in Figure 10-1. With this configuration, the CT1 and CT2 pins can be tied together to use one capacitor, CT.

See the TPS22966 Dual-Channel Load Switch in Parallel Configuration application report and Parallel Load Switches for Higher Output Current \& Reduced ON-Resistance Design Guide for more information.

Figure 10-1. Parallel Configuration

### 10.1.2 Standby Power Reduction

Battery powered end equipments often have strict power budgets, in which there is a need to reduce current consumption. The TPS22976 significantly reduces system current consumption by disabling the supply voltage to subsystems in standby states. Alternatively, the TPS22976 reduces the leakage current overhead of the modules in standby mode as achieved in Figure 10-2. Note that standby power reduction can be achieved on either channel, as well as dual-channel operation.

INSTRUMENTS

Figure 10-2. Standby Power Reduction

### 10.1.3 Power Supply Sequencing without GPIO Input

Sequential startup of several subsystems is often burdensome and adds complexity for several end equipments. The TPS22976 provides a power sequencing solution that reduces the overall system complexity, as seen in Figure 10-3.

Figure 10-3. Power Sequencing without a GPIO Input

### 10.1.4 Reverse Current Blocking

Reverse current blocking is often desired in specific applications, as it prevents current from flowing from the output to the input of the load switch when the device is disabled. With the configuration illustrated in Figure

10-4, the TPS22976 can be converted into a single-channel switch with reverse current blocking. VIN1 or VIN2 can be used as the input and VIN2 or VIN1 as the output.

Copyright © 2016, Texas Instruments Incorporated
Figure 10-4. Reverse Current Blocking

### 10.2 Typical Application

This application demonstrates how the TPS22976 can be used to limit the inrush current when powering on downstream modules.

Figure 10-5. Typical Application Circuit

### 10.2.1 Design Requirements

Table 10-1 shows the TPS22976 design parameters.
Table 10-1. Design Parameters

| DESIGN PARAMETER | VALUE |
| :---: | :---: |
| Input voltage | 3.3 V |
| Bias voltage | 5 V |
| Load capacitance $\left(\mathrm{C}_{\mathrm{L}}\right)$ | $22 \mu \mathrm{~F}$ |
| Maximum acceptable inrush current | 400 mA |

### 10.2.2 Detailed Design Procedure

### 10.2.2.1 Inrush Current

When the switch is enabled, the output capacitors must be charged up from 0 V to the set value ( 3.3 V in this example). This charge arrives in the form of inrush current. Inrush current can be calculated using Equation 1.

$$
\begin{equation*}
\text { Inrush Current }=\mathrm{C} \times \mathrm{dV} / \mathrm{dt} \tag{1}
\end{equation*}
$$

where

- C is the output capacitance
- dV is the output voltage
- dt is the rise time

The TPS22976 offers adjustable rise time for VOUT. This feature allows the user to control the inrush current during turnon. The appropriate rise time can be calculated using Table 10-1 and the inrush current equation. See Equation 2 and Equation 3.

$$
\begin{align*}
& 400 \mathrm{~mA}=22 \mu \mathrm{~F} \times 3.3 \mathrm{~V} / \mathrm{dt}  \tag{2}\\
& \mathrm{dt}=181.5 \mu \mathrm{~s} \tag{3}
\end{align*}
$$

To ensure an inrush current of less than 400 mA , choose a CT value that yields a rise time of more than 181.5 $\mu \mathrm{s}$. See the oscilloscope captures in the Application Curves section for an example of how the CT capacitor can be used to reduce inrush current.

Texas
INSTRUMENTS

### 10.2.2.2 Adjustable Rise Time

A capacitor to GND on the CT pins sets the slew rate for each channel. To ensure desired performance, a capacitor with a minimum voltage rating of 25 V must be used on either CT pins. An approximate formula for the relationship between CT and slew rate is shown in Equation 4, and this is valid for TPS22976 and TPS22976N. The TPS22976A has a faster rise time and is represented by Equation 5.

Equation 4 and Equation 5 account for $10 \%$ to $90 \%$ measurement on $\mathrm{V}_{\text {Out }}$ and do not apply for CT < 100 pF . Use Table 10-2 to determine rise times for when CT $=0 \mathrm{pF}$.

## TPS22976, TPS22976N:

$$
\begin{equation*}
\mathrm{SR}=0.42 \times \mathrm{CT}+66 \tag{4}
\end{equation*}
$$

TPS22976A:

$$
\begin{equation*}
S R=0.0606 \times C T+22 \tag{5}
\end{equation*}
$$

where

- $\quad$ SR is the slew rate (in $\mu \mathrm{s} / \mathrm{V}$ )
- CT is the capacitance value on the CT pin (in pF)
- The units for the constants 66 and 22 are in $\mu \mathrm{s} / \mathrm{V}$.

Rise time can be calculated by multiplying the input voltage by the slew rate. Table 10-2 shows rise time values measured on a typical device. Rise times shown below are only valid for the power-up sequence where $\mathrm{V}_{\mathrm{IN}}$ and $\mathrm{V}_{\text {BIAS }}$ are already in steady state condition, and the ON pin is asserted high.

Table 10-2. Rise Time Values (TPS22976, TPS22976N)

| CT (pF) | RISE TIME ( $\mu \mathrm{s}$ ) $10 \%-90 \%, C_{L}=0.1 \mu \mathrm{~F}, \mathrm{C}_{\mathrm{IN}}=1 \mu \mathrm{~F}, \mathrm{R}_{\mathrm{L}}=10 \Omega^{(1)}$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 5 V | 3.3 V | 1.8 V | 1.5 V | 1.2 V | 1.05 V | 0.6 V |
| 0 | 149 | 112 | 77 | 70 | 60 | 56 | 42 |
| 220 | 548 | 388 | 236 | 206 | 173 | 154 | 103 |

### 10.2.3 Application Curves

$\mathrm{V}_{\mathrm{BIAS}}=5 \mathrm{~V} ; \mathrm{V}_{\mathrm{IN}}=3.3 \mathrm{~V} ; \mathrm{C}_{\mathrm{L}}=22 \mu \mathrm{~F}$

## 11 Power Supply Recommendations

The device is designed to operate from a $\mathrm{V}_{\text {BIAS }}$ range of 2.5 V to 5.7 V and a $\mathrm{V}_{\text {IN }}$ range of 0.6 V to $\mathrm{V}_{\text {BIAS }}$.

## 12 Layout

### 12.1 Layout Guidelines

For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances may have on normal operation. Using wide traces for $\mathrm{V}_{\mathbb{I N}}, \mathrm{V}_{\mathrm{OUT}}$, and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

### 12.2 Layout Example

Notice the thermal vias located under the exposed thermal pad of the device. This allows for thermal diffusion away from the device.

Figure 12-1. PCB Layout Example

### 12.3 Power Dissipation

The maximum IC junction temperature must be restricted to $125^{\circ} \mathrm{C}$ under normal operating conditions. To calculate the maximum allowable power dissipation, $\mathrm{P}_{\mathrm{D}(\max )}$ for a given output current and ambient temperature, use Equation 6.

$$
\begin{equation*}
P_{D(\text { max })}=\frac{T_{J(\max )}-T_{A}}{\theta_{J A}} \tag{6}
\end{equation*}
$$

where

- $P_{D(\max )}$ is the maximum allowable power dissipation.
- $\mathrm{T}_{\mathrm{J}_{(\max )}}$ is the maximum allowable junction temperature $\left(125^{\circ} \mathrm{C}\right.$ for the TPS22976).
- $\mathrm{T}_{\mathrm{A}}$ is the ambient temperature of the device.
- $\theta_{\mathrm{JA}}$ is the junction to air thermal impedance. See the Thermal Information section. This parameter is highly dependent upon board layout.

## 13 Device and Documentation Support

### 13.1 Device Support

### 13.1.1 Developmental Support

For the TPS22976N PSpice Transient Model, see SLVMBV5.
For the TPS22976 PSpice Transient Model, see SLVMBV6.

### 13.2 Documentation Support

### 13.2.1 Related Documentation

For related documentation see the following:

## TPS22976 Evaluation Module User's Guide

### 13.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on Subscribe to updates to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 13.4 Support Resources

TI E2E ${ }^{\text {TM }}$ support forums are an engineer's go-to source for fast, verified answers and design help - straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

### 13.5 Trademarks

Ultrabook ${ }^{T M}$ is a trademark of Intel.
TI E2E ${ }^{\text {TM }}$ is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

### 13.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 13.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## 14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the mostcurrent data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material <br> (6) | MSL Peak Temp <br> (3) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TPS22976ADPUR | ACTIVE | WSON | DPU | 14 | 3000 | RoHS \& Green | NIPDAU | Level-2-260C-1 YEAR |
| TPS22976DPUR | ACTIVE | WSON | DPU | 14 | 3000 | RoHS \& Green | NIPDAU | Level-2-260C-1 YEAR |
| TPS22976DPUT | ACTIVE | WSON | DPU | 14 | 250 | RoHS \& Green | NIPDAU | Level-2-260C-1 YEAR |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design. PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including t do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in st reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption. Green: TI defines "Green" to mean the content of Chlorine ( Cl ) and Bromine ( Br ) based flame retardants meet JS709B low halogen requirements of $<=1000 \mathrm{ppI}$ flame retardants must also meet the $<=1000 \mathrm{ppm}$ threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a lir of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/E lines if the finish value exceeds the maximum column width.

DPU (R-PWSON-N14) PLASTIC SMALL OUTLINE NO-LEAD

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.
C. Small Outline No-Lead (SON) package configuration.

D The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
E. This package is Pb -free.

DPU (R-PWSON-N14)

## PLASTIC SMALL OUTLINE NO-LEAD

THERMAL INFORMATION
This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View
Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

DPU (R-PWSON-N14)

## PLASTIC SMALL OUTLINE NO-LEAD

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <http: //www.ti.com>.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
