### Enhanced product features

- Supports defense and aerospace applications (AQEC)
- Military temperature range (–55°C to +125°C)
- Controlled manufacturing baseline
- One assembly/test site
- One fabrication site
- Product change notification
- Qualification data available on request

### Low power, smallest pin-compatible octal DAC: 16 bits

### 16-lead TSSOP

### On-chip 1.25 V, 5 ppm/°C reference

### Power down to 400 nA at 5 V, 200 nA at 3 V

### 2.7 V to 5.5 V power supply

### Guaranteed monotonic by design

### Power-on reset to zero scale or midscale

### 3 power-down functions

### Hardware $\overline{\text{LDAC}}$ and $\overline{\text{LDAC}}$ override function

### CLR function to programmable code

### Rail-to-rail operation

## APPLICATIONS

### Process control

### Data acquisition systems

### Portable battery-powered instruments

## GENERAL DESCRIPTION

The [AD5668-EP](#) is a low power, octal, 16-bit, buffered voltage-output digital-to-analog converter (DAC). It operates from a single 2.7 V to 5.5 V supply and is guaranteed monotonic by design.

The [AD5668-EP](#) has an on-chip reference with an internal gain of 2. The [AD5668-EP](#) has a 1.25 V, 5 ppm/°C reference, giving a full-scale output range of 2.5 V. The on-board reference is off at power-up, allowing the use of an external reference, and the internal reference is enabled via a software write.

The part incorporates a power-on-reset circuit that ensures that the DAC output powers up to 0 V and remains powered up at this level until a valid write takes place. The part contains a power-down feature that reduces the current consumption of the device to 400 nA at 5 V and provides software-selectable output loads while in power-down mode for any or all DAC channels. The outputs of all DACs can be updated simultaneously using the  $\overline{\text{LDAC}}$  function, with the added functionality of user-selectable

DAC channels to simultaneously update. There is also an asynchronous CLR that updates all DACs to a user-programmable code—zero scale, midscale, or full scale.

The [AD5668-EP](#) uses a versatile 3-wire serial interface that operates at clock rates up to 50 MHz and is compatible with standard SPI, QSPI, MICROWIRE, and DSP interface standards.

Additional application and technical information can be found in the [AD5668](#) data sheet.

## PRODUCT HIGHLIGHTS

1. Octal, 16-bit DAC.
2. On-chip 1.25 V/2.5 V, 5 ppm/°C reference.
3. Available in 16-lead TSSOP.
4. Power-on reset to 0 V or midscale.
5. Power-down capability. When powered down, the DAC typically consumes 200 nA at 3 V and 400 nA at 5 V.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

### ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 3. Pin Configuration

Table 5. Pin Function Descriptions

Pin Number	Mnemonic	Description
1	$\overline{\text{LDAC}}$	Active Low Control Input. Pulsing this pin low allows any or all DAC registers to be updated if the input registers have new data. This allows all DAC outputs to update simultaneously. Alternatively, this pin can permanently be tied low.
2	$\overline{\text{SYNC}}$	Active Low Control Input. This is the frame synchronization signal for the input data. When $\overline{\text{SYNC}}$ goes low, it powers on the SCLK and DIN buffers and enables the input shift register. Data is transferred in on the falling edges of the next 32 clocks. If $\overline{\text{SYNC}}$ is taken high before the 32 <sup>nd</sup> falling edge, the rising edge of $\overline{\text{SYNC}}$ acts as an interrupt and the write sequence is ignored by the device.
3	$V_{\text{DD}}$	Power Supply Input. This device can be operated from 2.7 V to 5.5 V, and it is recommended the supply be decoupled with a 10 $\mu\text{F}$ capacitor in parallel with a 0.1 $\mu\text{F}$ capacitor to GND.
4	$V_{\text{OUTA}}$	Analog Output Voltage from DAC A. The output amplifier has rail-to-rail operation.
5	$V_{\text{OUTC}}$	Analog Output Voltage from DAC C. The output amplifier has rail-to-rail operation.
6	$V_{\text{OUTE}}$	Analog Output Voltage from DAC E. The output amplifier has rail-to-rail operation.
7	$V_{\text{OUTG}}$	Analog Output Voltage from DAC G. The output amplifier has rail-to-rail operation.
8	$V_{\text{REFIN}}/$ $V_{\text{REFOUT}}$	Common Pin for Reference Input and Reference Output. When using the internal reference, this is the reference output pin. When using an external reference, this is the reference input pin. The default for this pin is a reference input.
9	$\overline{\text{CLR}}$	Asynchronous Clear Input. The $\overline{\text{CLR}}$ input is falling edge sensitive. When $\overline{\text{CLR}}$ is low, all $\overline{\text{LDAC}}$ pulses are ignored. When $\overline{\text{CLR}}$ is activated, the input register and the DAC register are updated with the data contained in the $\overline{\text{CLR}}$ code register: zero, midscale, or full-scale. Default setting clears the output to 0 V.
10	$V_{\text{OUTH}}$	Analog Output Voltage from DAC H. The output amplifier has rail-to-rail operation.
11	$V_{\text{OUTF}}$	Analog Output Voltage from DAC F. The output amplifier has rail-to-rail operation.
12	$V_{\text{OUTD}}$	Analog Output Voltage from DAC D. The output amplifier has rail-to-rail operation.
13	$V_{\text{OUTB}}$	Analog Output Voltage from DAC B. The output amplifier has rail-to-rail operation.
14	GND	Ground Reference Point for All Circuitry on the Device.
15	DIN	Serial Data Input. This device has a 32-bit shift register. Data is clocked into the register on the falling edge of the serial clock input.
16	SCLK	Serial Clock Input. Data is clocked into the input shift register on the falling edge of the serial clock input. Data can be transferred at rates of up to 50 MHz.
